

Make the ocean observable.

A distributed network of coastal nodes, vessel integrations and edge intelligence that turns real ocean observations into persistent, queryable data.

PRE-SEED TARGET

\$1.2M

~18 months

FOUNDER FUNDED

~\$48K

No institutional capital

STAGE

Pre-revenue

Prototype / pre-MVP

Jorge Pimentel | Founder & CTO

PROBLEM

The ocean is measured in snapshots.

For many operational decisions, the missing layer is persistent local ground truth.

TODAY

TRITON

Satellites, buoys and research campaigns are valuable. Triton is designed to fill the persistence and local-density gap between them.

Persistent

Continuous observation

Local

Near-shore and vessel ground truth

Operational

Data designed for decisions

One network. Multiple observation surfaces.

The system is designed to scale through nodes and integrations, not through ownership of a fleet.

BeachNode + SailNode + vessel integrations + environmental sensors → edge AI → Triton data platform → persistent ocean intelligence

The same core infrastructure can support coastal monitoring, maritime awareness, environmental intelligence and future specialized applications.

Node 001 is the proof point.

The sailboat is the mobile development and validation platform. The network is the product.

EDGECORE 001

Compute	Local AI + data
Storage	Offline resilience
Networking	Managed links
Sensors	NMEA / AIS / GNSS

01	Bench test	Power, thermals, storage, failover
02	Field test	Real ocean conditions and connectivity loss
03	Deployment gate	Reliable data flowing into Triton platform

Prototype hardware ceiling: <\$2,000 for the compact onboard EdgeCore, excluding major vessel systems and external sensors.

Start with a narrow coastal wedge.

South Florida gives Triton a dense set of visible problems, agencies, operators and deployment environments.

INITIAL USE CASES

- Sargassum arrival intelligence
- Water-quality anomalies
- Beach and near-shore conditions

First objective: paid pilot

COMMERCIAL SEQUENCE

- | | | |
|---|---------|---------------------------------------|
| 1 | Deploy | Prove reliability |
| 2 | Observe | Generate proprietary data |
| 3 | Deliver | Put intelligence in a user's workflow |
| 4 | Convert | Paid pilot / contract |

Current status: pre-revenue. BeachLens is an exploratory collaboration discussion, not a customer or formal partnership.

Hardware opens the door. Intelligence creates recurring value.

1. Deploy

Hardware + integration

2. Connect

Monitoring + data access

3. Interpret

Analytics + alerts + APIs

4. Expand

More sites, vessels and use cases

THE COMPOUNDING LOOP

01

More nodes

02

More proprietary observations

03

Better models + intelligence

04

More customer value

Pricing, margins and contract values remain assumptions until the first paid pilots establish real unit economics.

The moat is accumulated observation, not a single sensor.

01 Network density

More observation points in places generic datasets do not continuously cover.

02 Longitudinal data

A proprietary record that becomes more valuable with time.

03 Edge intelligence

Local inference and resilience when bandwidth is constrained.

04 Interoperability

Triton observations become more useful when fused with external ocean data.

The strategic asset is the growing, queryable record of what the ocean was doing at a specific place, depth and time.

STATUS

Early enough to be honest. Far enough to execute.

FOUNDER CAPITAL

~\$48K

invested to date

INSTITUTIONAL CAPITAL

\$0

raised to date

PAYING CUSTOMERS

0

pre-revenue

STAGE

Pre-MVP

prototype build

BUILT

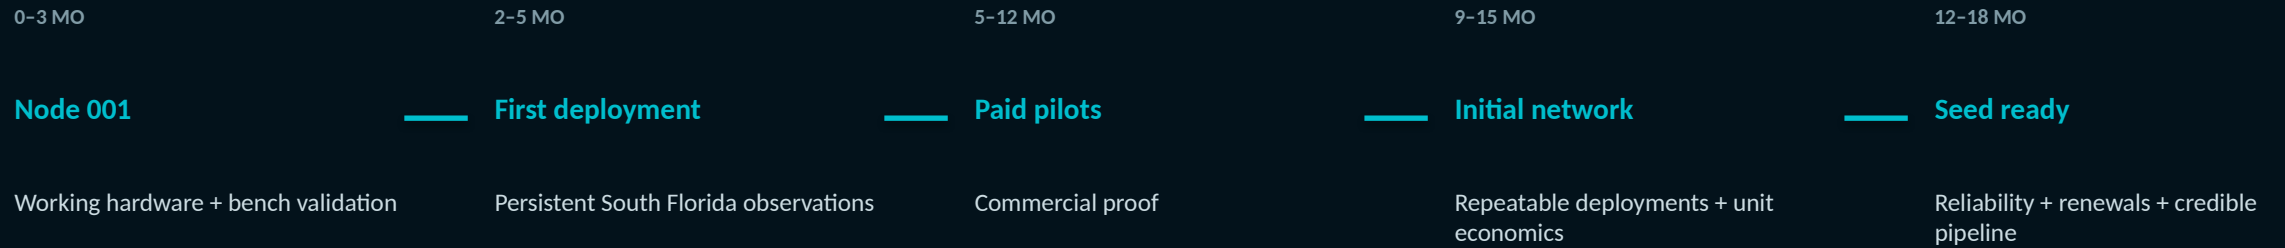

Initial DeepSeaGuard software foundation and current ocean intelligence software prototypes.

BUILDING

BeachNode 001, EdgeCore / SailNode architecture, first field deployments and customer pipeline.

No field-tested fleet claims. No borrowed user counts. No revenue presented before it exists.

Every milestone removes a financing risk.

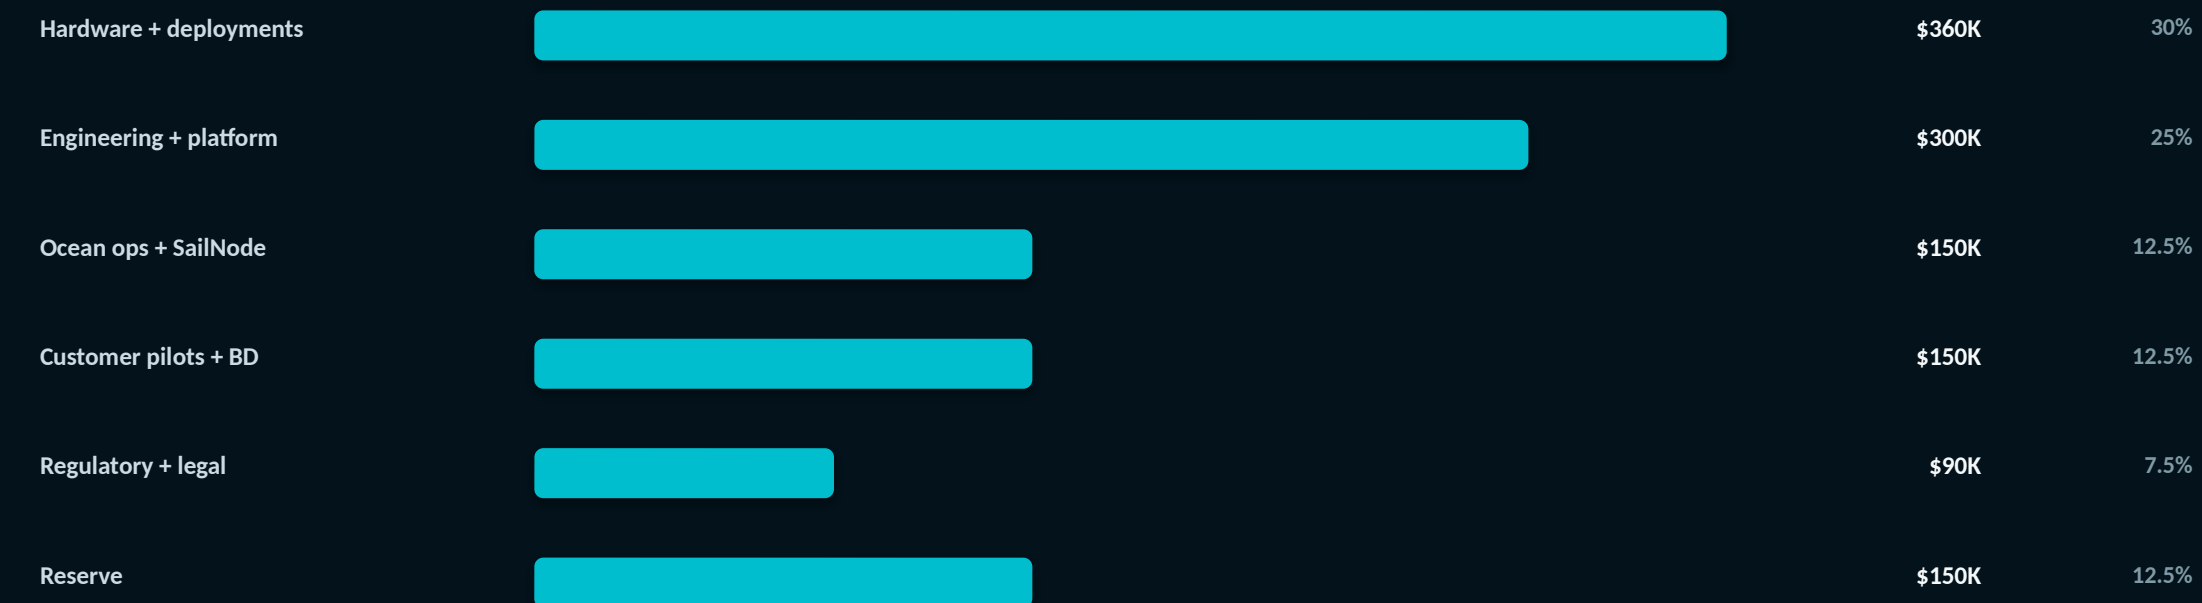

Financing gate

Deployed infrastructure + proprietary observations + measured network economics + paying customers.

\$1.2M pre-seed. Approximately 18 months.

Capital is allocated against technical and commercial de-risking, with reserve held for the constraint that emerges in field operations.

The round is designed to reach a measurable de-risking point, not simply extend runway.

Build the physical layer and the intelligence layer together.

Jorge Pimentel

Founder & CTO

Founder funded Triton with approximately \$48K to date and is leading the product direction, engineering architecture, field validation and early go-to-market.

WHY THIS

Persistent ocean observation is still difficult, expensive and fragmented.

WHY THIS APPROACH

The problem crosses hardware, communications, edge compute, field operations and software. Triton is being designed as one integrated system.

Long-term defensibility: network density + longitudinal proprietary data.

The ocean does not need
another dashboard.

It needs an observation network.

We are building it.
